

MERIDIAN HOLLOW — Company Fact Sheet

Overview

Meridian Hollow is a freshwater desalination startup founded in 2019 in Reykjavik, Iceland. The company builds compact, modular purification units called "Tidepods" for remote coastal communities. As of 2025 it employs 142 people across three offices.

The Tidepod Product Line

The flagship product, the Tidepod-3, processes up to 4,000 litres of seawater per day and runs entirely on solar power. It weighs 38 kilograms and can be assembled by two people in under 45 minutes. The earlier Tidepod-2 model, discontinued in 2023, processed only 1,500 litres per day. Each Tidepod-3 uses a proprietary graphene-oxide membrane rated for 5 years of continuous use before replacement.

Pricing & Deployment

A single Tidepod-3 unit costs 8,900 USD. Meridian Hollow offers a subscription maintenance plan at 600 USD per year, which includes one free membrane replacement. The company has deployed 1,270 units across 14 countries, with the largest deployment — 300 units — in coastal Kenya as part of the "BlueWell" initiative launched in 2022.

Leadership

The CEO is Dr. Anneli Vos, a former marine biologist who co-founded the company. The CTO, Rajiv Menon, previously worked on membrane technology at a Singaporean water utility. The company raised a 12 million USD Series A round in 2021, led by Northwind Ventures.

Sustainability Commitments

Meridian Hollow pledged to be carbon-neutral by 2027. All Tidepod packaging is made from recycled ocean plastic. In 2024 the company recycled 2.3 tonnes of decommissioned membranes through a partner facility in Rotterdam.
